

 Artifacts > Walkthrough

Walkthrough

Agent creates walkthrough artifacts when it has completed task implementation; this type of artifact includes a concise summary of the changes that have been made to remind the user of what has happened in the active conversation. This is a great way to get up to speed with the state of your codebase after Agent has made its changes in case you were not strictly following it the whole time.

The screenshot shows a walkthrough artifact for a 'Weather Aggregation Web App'. It includes an overview, a list of what was built (Backend Services, Location Service, Weather Aggregator, Express Server), and a REST API table.

Weather Aggregation Web App - Walkthrough

Overview

I've successfully built a complete weather aggregation web application that combines data from multiple weather APIs and uses an ML-based consensus algorithm to provide accurate hour-by-hour forecasts for random locations worldwide.

What Was Built

Backend Services

- Weather Provider Integrations (`weatherProviders.js`)**
Integrated three weather APIs with data normalization:
 - OpenWeatherMap:** 3-hour interval forecasts
 - Open-Meteo:** High-resolution hourly forecasts (no API key required)
 - WeatherAPI.com:** 14-day hourly forecastsEach provider's data is normalized to a standard format with:
 - Temperature (°C)
 - Feels-like temperature
 - Precipitation amount and probability
 - Wind speed and direction
 - Weather conditions and descriptions
- ML-Based Consensus Algorithm (`consensusAlgorithm.js`)**
Implements sophisticated aggregation logic:
 - Weighted averaging** for numerical values (temperature, wind, precipitation)
 - Circular averaging** for wind direction (handles 0°/360° wrap-around)
 - Voting system** for categorical data (weather conditions)
 - Confidence scoring** based on provider agreement (uses standard deviation and condition consensus)
- Location Service (`locationService.js`)**
Generates random coordinates with intelligent land bias:
 - Weighted random selection favoring populated regions
 - Covers 6 major world regions (North America, South America, Europe, Africa, Asia, Oceania)
 - Basic location naming based on coordinates
- Weather Aggregator (`weatherAggregator.js`)**
Main orchestration service:
 - Coordinates parallel API calls to all providers
 - Applies consensus algorithm to aggregate data
 - Implements caching (30-minute TTL by default)
 - Graceful degradation when providers fail

Express Server (`server.js`)

REST API with three endpoints:

Endpoint	Method	Description
<code>/api/random-location</code>	GET	Generate random coordinates
<code>/api/weather?lat={lat}&lon={lon}</code>	GET	Get aggregated forecast
<code>/api/cache/clear</code>	POST	Clear weather cache

For browser tasks, walkthroughs often contain screenshots and screen recordings of what Agent has built or created in the browser!

Artifacts > Walkthrough

1. Navigate to <http://localhost:3000>

2. Scroll down to the "Our Menu" section.

3. Verify that the images for the dishes are visible (not broken).

4. Take a screenshot of the menu with the new images.

📸 Capturing a screenshot of the menu sect

View

I have navigated to <http://localhost:3000>, scrolled down to the "Our Menu" section, and verified that the new images for the dishes are visible and loading correctly. I have taken a screenshot of the menu section showing the real images.

📄 Edited ⌵ Task

View

I've updated the website with real images for all the dishes.

- Generated 6 high-quality food photos matching the theme.
- Updated the gallery to display them.
- Verified everything looks good locally.

You can check out the updated walkthrough for a screenshot of the new menu.

🔗 Walkthrough

Open

Added verification of real images to the walkthrough.
